

Higher Order Linear Equations

4.1

1. The differential equation is in standard form. Its coefficients, as well as the function $g(t) = t$, are continuous everywhere. Hence solutions are valid on the entire real line.
3. Writing the equation in standard form, the coefficients are rational functions with singularities at $t = 0$ and $t = 1$. Hence the solutions are valid on the intervals $(-\infty, 0)$, $(0, 1)$, and $(1, \infty)$.
4. The coefficients are continuous everywhere, but the function $g(t) = \ln t$ is defined and continuous only on the interval $(0, \infty)$. Hence solutions are defined for positive reals.
5. Writing the equation in standard form, the coefficients are rational functions with a singularity at $x_0 = 1$. Furthermore, $p_4(x) = \tan x/(x - 1)$ is undefined, and hence not continuous, at $x_k = \pm(2k + 1)\pi/2$, $k = 0, 1, 2, \dots$. Hence solutions are defined on any interval that does not contain x_0 or x_k .
6. Writing the equation in standard form, the coefficients are rational functions with singularities at $x = \pm 2$. Hence the solutions are valid on the intervals $(-\infty, -2)$, $(-2, 2)$, and $(2, \infty)$.

7. Evaluating the Wronskian of the three functions, $W(f_1, f_2, f_3) = -14$. Hence the functions are linearly independent.

9. Evaluating the Wronskian of the four functions, $W(f_1, f_2, f_3, f_4) = 0$. Hence the functions are linearly dependent. To find a linear relation among the functions, we need to find constants c_1, c_2, c_3, c_4 , not all zero, such that

$$c_1 f_1(t) + c_2 f_2(t) + c_3 f_3(t) + c_4 f_4(t) = 0.$$

Collecting the common terms, we obtain

$$(c_2 + 2c_3 + c_4)t^2 + (2c_1 - c_3 + c_4)t + (-3c_1 + c_2 + c_4) = 0,$$

which results in three equations in four unknowns. Arbitrarily setting $c_4 = -1$, we can solve the equations $c_2 + 2c_3 = 1$, $2c_1 - c_3 = 1$, $-3c_1 + c_2 = 1$, to find that $c_1 = 2/7$, $c_2 = 13/7$, $c_3 = -3/7$. Hence

$$2f_1(t) + 13f_2(t) - 3f_3(t) - 7f_4(t) = 0.$$

10. Evaluating the Wronskian of the three functions, $W(f_1, f_2, f_3) = 156$. Hence the functions are linearly independent.

11. Substitution verifies that the functions are solutions of the ODE. Furthermore, we have $W(1, \cos t, \sin t) = 1$.

12. Substitution verifies that the functions are solutions of the ODE. Furthermore, we have $W(1, t, \cos t, \sin t) = 1$.

14. Substitution verifies that the functions are solutions of the ODE. Furthermore, we have $W(1, t, e^{-t}, t e^{-t}) = e^{-2t}$.

15. Substitution verifies that the functions are solutions of the ODE. Furthermore, we have $W(1, x, x^3) = 6x$.

16. Substitution verifies that the functions are solutions of the ODE. Furthermore, we have $W(x, x^2, 1/x) = 6/x$.

18. The operation of taking a derivative is linear, and hence

$$(c_1 y_1 + c_2 y_2)^{(k)} = c_1 y_1^{(k)} + c_2 y_2^{(k)}.$$

It follows that

$$L[c_1 y_1 + c_2 y_2] = c_1 y_1^{(n)} + c_2 y_2^{(n)} + p_1(c_1 y_1^{(n-1)} + c_2 y_2^{(n-1)}) + \dots + p_n(c_1 y_1 + c_2 y_2).$$

Rearranging the terms, we obtain $L[c_1 y_1 + c_2 y_2] = c_1 L[y_1] + c_2 L[y_2]$. Since y_1 and y_2 are solutions, $L[c_1 y_1 + c_2 y_2] = 0$. The rest follows by induction.

19.(a) Note that $d^k(t^n)/dt^k = n(n-1)\dots(n-k+1)t^{n-k}$, for $k = 1, 2, \dots, n$. Hence

$$L[t^n] = a_0 n! + a_1 [n(n-1)\dots 2]t + \dots a_{n-1} n t^{n-1} + a_n t^n.$$

(b) We have $d^k(e^{rt})/dt^k = r^k e^{rt}$, for $k = 0, 1, 2, \dots$. Hence

$$\begin{aligned} L[e^{rt}] &= a_0 r^n e^{rt} + a_1 r^{n-1} e^{rt} + \dots a_{n-1} r e^{rt} + a_n e^{rt} \\ &= [a_0 r^n + a_1 r^{n-1} + \dots a_{n-1} r + a_n] e^{rt}. \end{aligned}$$

(c) Set $y = e^{rt}$, and substitute into the ODE. It follows that $r^4 - 5r^2 + 4 = 0$, with $r = \pm 1, \pm 2$. Furthermore, $W(e^t, e^{-t}, e^{2t}, e^{-2t}) = 72$.

20.(a) Let $f(t)$ and $g(t)$ be arbitrary functions. Then $W(f, g) = fg' - f'g$. Hence $W'(f, g) = f'g' + fg'' - f''g - f'g' = fg'' - f''g$. That is,

$$W'(f, g) = \begin{vmatrix} f & g \\ f'' & g'' \end{vmatrix}.$$

Now expand the 3-by-3 determinant as

$$W(y_1, y_2, y_3) = y_1 \begin{vmatrix} y_2' & y_3' \\ y_2'' & y_3'' \end{vmatrix} - y_2 \begin{vmatrix} y_1' & y_3' \\ y_1'' & y_3'' \end{vmatrix} + y_3 \begin{vmatrix} y_1' & y_2' \\ y_1'' & y_2'' \end{vmatrix}.$$

Differentiating, we obtain

$$\begin{aligned} W'(y_1, y_2, y_3) &= y_1' \begin{vmatrix} y_2' & y_3' \\ y_2'' & y_3'' \end{vmatrix} - y_2' \begin{vmatrix} y_1' & y_3' \\ y_1'' & y_3'' \end{vmatrix} + y_3' \begin{vmatrix} y_1' & y_2' \\ y_1'' & y_2'' \end{vmatrix} + \\ &+ y_1 \begin{vmatrix} y_2'' & y_3'' \\ y_2''' & y_3''' \end{vmatrix} - y_2 \begin{vmatrix} y_1'' & y_3'' \\ y_1''' & y_3''' \end{vmatrix} + y_3 \begin{vmatrix} y_1'' & y_2'' \\ y_1''' & y_2''' \end{vmatrix}. \end{aligned}$$

The second line follows from the observation above. Now we find that

$$W'(y_1, y_2, y_3) = \begin{vmatrix} y_1' & y_2' & y_3' \\ y_1'' & y_2'' & y_3'' \\ y_1''' & y_2''' & y_3''' \end{vmatrix} + \begin{vmatrix} y_1 & y_2 & y_3 \\ y_1' & y_2' & y_3' \\ y_1'' & y_2'' & y_3'' \end{vmatrix}.$$

Hence the assertion is true, since the first determinant is equal to zero.

(b) Based on the properties of determinants,

$$p_2(t)p_3(t)W' = \begin{vmatrix} p_3 y_1 & p_3 y_2 & p_3 y_3 \\ p_2 y_1' & p_2 y_2' & p_2 y_3' \\ y_1''' & y_2''' & y_3''' \end{vmatrix}$$

Adding the first two rows to the third row does not change the value of the determinant. Since the functions are assumed to be solutions of the given ODE, addition of the rows results in

$$p_2(t)p_3(t)W' = \begin{vmatrix} p_3 y_1 & p_3 y_2 & p_3 y_3 \\ p_2 y_1' & p_2 y_2' & p_2 y_3' \\ -p_1 y_1'' & -p_1 y_2'' & -p_1 y_3'' \end{vmatrix}.$$

It follows that $p_2(t)p_3(t)W' = -p_1(t)p_2(t)p_3(t)W$. As long as the coefficients are not zero, we obtain $W' = -p_1(t)W$.

(c) The first order equation $W' = -p_1(t)W$ is linear, with integrating factor $\mu(t) = e^{\int p_1(t)dt}$. Hence $W(t) = c e^{-\int p_1(t)dt}$. Furthermore, $W(t)$ is zero only if $c = 0$.

(d) It can be shown, by mathematical induction, that

$$W'(y_1, y_2, \dots, y_n) = \begin{vmatrix} y_1 & y_2 & \cdots & y_{n-1} & y_n \\ y_1' & y_2' & \cdots & y_{n-1}' & y_n' \\ \vdots & \vdots & & \vdots & \vdots \\ y_1^{(n-2)} & y_2^{(n-2)} & \cdots & y_{n-1}^{(n-2)} & y_n^{(n-2)} \\ y_1^{(n)} & y_2^{(n)} & \cdots & y_{n-1}^{(n)} & y_n^{(n)} \end{vmatrix}.$$

Based on the reasoning in part (b), it follows that

$$p_2(t)p_3(t)\cdots p_n(t)W' = -p_1(t)p_2(t)p_3(t)\cdots p_n(t)W,$$

and hence $W' = -p_1(t)W$.

21. Inspection of the coefficients reveals that $p_1(t) = 2$. Based on Problem 20, we find that $W' = -2W$, and hence $W = ce^{-2t}$.

22. Inspection of the coefficients reveals that $p_1(t) = 0$. Based on Problem 20, we find that $W' = 0$, and hence $W = c$.

23. After writing the equation in standard form, observe that $p_1(t) = 2/t$. Based on the results in Problem 20, we find that $W' = (-2/t)W$, and hence $W = c/t^2$.

24. Writing the equation in standard form, we find that $p_1(t) = 1/t$. Using Abel's formula, the Wronskian has the form $W(t) = ce^{-\int \frac{1}{t} dt} = c/t$.

25.(a) On the interval $(-1, 0)$, $f(t) = t^2|t| = -t^3 = -g(t)$, and on the interval $(0, 1)$, $f(t) = t^2|t| = t^3 = g(t)$. This shows that on these intervals the functions are linearly dependent.

(b) On the interval $(-1, 1)$ these two functions are linearly independent, because if $c_1f(t) + c_2g(t) = 0$ for every t , then for $t = 1/2$ we obtain $c_1 + c_2 = 0$ and for $t = -1/2$ we get $c_1 - c_2 = 0$, which implies that $c_1 = c_2 = 0$.

(c) The Wronskian is

$$W(f, g)(t) = \begin{vmatrix} t^2|t| & t^3 \\ 3t|t| & 3t^2 \end{vmatrix} = 3t^4|t| - 3t^4|t| = 0.$$

26. Let $y(t) = y_1(t)v(t)$. Then $y' = y_1'v + y_1v'$, $y'' = y_1''v + 2y_1'v' + y_1v''$, and $y''' = y_1'''v + 3y_1''v' + 3y_1'v'' + y_1v'''$. Substitution into the ODE results in

$$\begin{aligned} & y_1'''v + 3y_1''v' + 3y_1'v'' + y_1v''' + p_1[y_1''v + 2y_1'v' + y_1v''] + \\ & + p_2[y_1'v + y_1v'] + p_3y_1v = 0. \end{aligned}$$

Since y_1 is assumed to be a solution, all terms containing the factor $v(t)$ vanish. Hence

$$y_1v''' + [p_1y_1 + 3y_1']v'' + [3y_1'' + 2p_1y_1' + p_2y_1]v' = 0,$$

which is a second order ODE in the variable $u = v'$.

28. First write the equation in standard form:

$$y''' - 3\frac{t+2}{t(t+3)}y'' + 6\frac{t+1}{t^2(t+3)}y' - \frac{6}{t^2(t+3)}y = 0.$$

Let $y(t) = t^2v(t)$. Substitution into the given ODE results in

$$t^2v''' + 3\frac{t(t+4)}{t+3}v'' = 0.$$

Set $w = v''$. Then w is a solution of the first order differential equation

$$w' + 3\frac{t+4}{t(t+3)}w = 0.$$

This equation is linear, with integrating factor $\mu(t) = t^4/(t+3)$. The general solution is $w = c(t+3)/t^4$. Integrating twice, $v(t) = c_1t^{-1} + c_1t^{-2} + c_2t + c_3$. Hence $y(t) = c_1t + c_1 + c_2t^3 + c_3t^2$. Finally, since $y_1(t) = t^2$ and $y_2(t) = t^3$ are given solutions, the third independent solution is $y_3(t) = c_1t + c_1$.

4.2

1. The magnitude of $1+i$ is $R = \sqrt{2}$ and the polar angle is $\pi/4$. Hence the polar form is given by $1+i = \sqrt{2}e^{i\pi/4}$.

3. The magnitude of -3 is $R = 3$ and the polar angle is π . Hence $-3 = 3e^{i\pi}$.

4. The magnitude of $-i$ is $R = 1$ and the polar angle is $3\pi/2$. Hence $-i = e^{3\pi i/2}$.

5. The magnitude of $\sqrt{3}-i$ is $R = 2$ and the polar angle is $-\pi/6 = 11\pi/6$. Hence the polar form is given by $\sqrt{3}-i = 2e^{11\pi i/6}$.

6. The magnitude of $-1-i$ is $R = \sqrt{2}$ and the polar angle is $5\pi/4$. Hence the polar form is given by $-1-i = \sqrt{2}e^{5\pi i/4}$.

7. Writing the complex number in polar form, $1 = e^{2m\pi i}$, where m may be any integer. Thus $1^{1/3} = e^{2m\pi i/3}$. Setting $m = 0, 1, 2$ successively, we obtain the three roots as $1^{1/3} = 1$, $1^{1/3} = e^{2\pi i/3}$, $1^{1/3} = e^{4\pi i/3}$. Equivalently, the roots can also be written as 1 , $\cos(2\pi/3) + i\sin(2\pi/3) = \frac{1}{2}(-1 + i\sqrt{3})$, $\cos(4\pi/3) + i\sin(4\pi/3) = \frac{1}{2}(-1 - i\sqrt{3})$.

9. Writing the complex number in polar form, $1 = e^{2m\pi i}$, where m may be any integer. Thus $1^{1/4} = e^{2m\pi i/4}$. Setting $m = 0, 1, 2, 3$ successively, we obtain the three roots as $1^{1/4} = 1$, $1^{1/4} = e^{\pi i/2}$, $1^{1/4} = e^{\pi i}$, $1^{1/4} = e^{3\pi i/2}$. Equivalently, the roots can also be written as 1 , $\cos(\pi/2) + i\sin(\pi/2) = i$, $\cos(\pi) + i\sin(\pi) = -1$, $\cos(3\pi/2) + i\sin(3\pi/2) = -i$.

10. In polar form, $2(\cos \pi/3 + i \sin \pi/3) = 2e^{i\pi/3+2m\pi}$, in which m is any integer. Thus $[2(\cos \pi/3 + i \sin \pi/3)]^{1/2} = 2^{1/2}e^{i\pi/6+m\pi}$. With $m = 0$, one square root is given by $2^{1/2}e^{i\pi/6} = (\sqrt{3} + i)/\sqrt{2}$. With $m = 1$, the other root is given by $2^{1/2}e^{i7\pi/6} = (-\sqrt{3} - i)/\sqrt{2}$.

11. The characteristic equation is $r^3 - r^2 - r + 1 = 0$. The roots are $r = -1, 1, 1$. One root is repeated, hence the general solution is $y = c_1e^{-t} + c_2e^t + c_3te^t$.

13. The characteristic equation is $r^3 - 2r^2 - r + 2 = 0$, with roots $r = -1, 1, 2$. The roots are real and distinct, so the general solution is $y = c_1e^{-t} + c_2e^t + c_3e^{2t}$.

14. The characteristic equation can be written as $r^2(r^2 - 4r + 4) = 0$. The roots are $r = 0, 0, 2, 2$. There are two repeated roots, and hence the general solution is given by $y = c_1 + c_2t + c_3e^{2t} + c_4te^{2t}$.

15. The characteristic equation is $r^6 + 1 = 0$. The roots are given by $r = (-1)^{1/6}$, that is, the six sixth roots of -1 . They are $e^{-\pi i/6+m\pi i/3}$, $m = 0, 1, \dots, 5$. Explicitly, $r = (\sqrt{3} - i)/2$, $(\sqrt{3} + i)/2$, i , $-i$, $(-\sqrt{3} + i)/2$, $(-\sqrt{3} - i)/2$. Hence the general solution is given by

$$y = e^{\sqrt{3}t/2} [c_1 \cos(t/2) + c_2 \sin(t/2)] + c_3 \cos t + c_4 \sin t + e^{-\sqrt{3}t/2} [c_5 \cos(t/2) + c_6 \sin(t/2)].$$

16. The characteristic equation can be written as $(r^2 - 1)(r^2 - 4) = 0$. The roots are given by $r = \pm 1, \pm 2$. The roots are real and distinct, hence the general solution is $y = c_1e^{-t} + c_2e^t + c_3e^{-2t} + c_4e^{2t}$.

17. The characteristic equation can be written as $(r^2 - 1)^3 = 0$. The roots are given by $r = \pm 1$, each with multiplicity three. Hence the general solution is

$$y = c_1e^{-t} + c_2te^{-t} + c_3t^2e^{-t} + c_4e^t + c_5te^t + c_6t^2e^t.$$

18. The characteristic equation can be written as $r^2(r^4 - 1) = 0$. The roots are given by $r = 0, 0, \pm 1, \pm i$. The general solution is

$$y = c_1 + c_2t + c_3e^{-t} + c_4e^t + c_5 \cos t + c_6 \sin t.$$

19. The characteristic equation can be written as $r(r^4 - 3r^3 + 3r^2 - 3r + 2) = 0$. Examining the coefficients, it follows that

$$r^4 - 3r^3 + 3r^2 - 3r + 2 = (r - 1)(r - 2)(r^2 + 1).$$

Hence the roots are $r = 0, 1, 2, \pm i$. The general solution of the ODE is given by $y = c_1 + c_2e^t + c_3e^{2t} + c_4 \cos t + c_5 \sin t$.

20. The characteristic equation can be written as $r(r^3 - 8) = 0$, with roots $r = 0, 2e^{2m\pi i/3}$, $m = 0, 1, 2$. That is, $r = 0, 2, -1 \pm i\sqrt{3}$. Hence the general solution is $y = c_1 + c_2e^{2t} + e^{-t} [c_3 \cos \sqrt{3}t + c_4 \sin \sqrt{3}t]$.

21. The characteristic equation can be written as $(r^4 + 4)^2 = 0$. The roots of the equation $r^4 + 4 = 0$ are $r = 1 \pm i, -1 \pm i$. Each of these roots has multiplicity two. The general solution is

$$y = e^t [c_1 \cos t + c_2 \sin t] + te^t [c_3 \cos t + c_4 \sin t] + e^{-t} [c_5 \cos t + c_6 \sin t] + te^{-t} [c_7 \cos t + c_8 \sin t].$$

22. The characteristic equation can be written as $(r^2 + 1)^2 = 0$. The roots are given by $r = \pm i$, each with multiplicity two. The general solution is

$$y = c_1 \cos t + c_2 \sin t + t [c_3 \cos t + c_4 \sin t].$$

24. The characteristic equation is $r^3 + 5r^2 + 6r + 2 = 0$. Examining the coefficients, we find that $r^3 + 5r^2 + 6r + 2 = (r + 1)(r^2 + 4r + 2)$. Hence the roots are deduced as $r = -1, -2 \pm \sqrt{2}$. The general solution is

$$y = c_1 e^{-t} + c_2 e^{(-2+\sqrt{2})t} + c_3 e^{(-2-\sqrt{2})t}.$$

25. The characteristic equation is $18r^3 + 21r^2 + 14r + 4 = 0$. By examining the first and last coefficients, we find that

$$18r^3 + 21r^2 + 14r + 4 = (2r + 1)(9r^2 + 6r + 4).$$

Hence the roots are $r = -1/2, (-1 \pm \sqrt{3}i)/3$. The general solution of the ODE is given by $y = c_1 e^{-t/2} + e^{-t/3} [c_2 \cos(t/\sqrt{3}) + c_3 \sin(t/\sqrt{3})]$.

26. The characteristic equation is $r^4 - 7r^3 + 6r^2 + 30r - 36 = 0$. By examining the first and last coefficients, we find that

$$r^4 - 7r^3 + 6r^2 + 30r - 36 = (r - 3)(r + 2)(r^2 - 6r + 6).$$

The roots are $r = -2, 3, 3 \pm \sqrt{3}$. The general solution is

$$y = c_1 e^{-2t} + c_2 e^{3t} + c_3 e^{(3-\sqrt{3})t} + c_4 e^{(3+\sqrt{3})t}.$$

28. The characteristic equation is $r^4 + 6r^3 + 17r^2 + 22r + 14 = 0$. It can be shown that $r^4 + 6r^3 + 17r^2 + 22r + 14 = (r^2 + 2r + 2)(r^2 + 4r + 7)$. Hence the roots are $r = -1 \pm i, -2 \pm i\sqrt{3}$. The general solution is

$$y = e^{-t} [c_1 \cos t + c_2 \sin t] + e^{-2t} [c_3 \cos \sqrt{3}t + c_4 \sin \sqrt{3}t].$$

30. $y(t) = \frac{1}{2}e^{-t/\sqrt{2}} \sin(t/\sqrt{2}) - \frac{1}{2}e^{t/\sqrt{2}} \sin(t/\sqrt{2})$.

32. The characteristic equation is $r^3 - r^2 + r - 1 = 0$, with roots $r = 1, \pm i$. Hence the general solution is $y(t) = c_1 e^t + c_2 \cos t + c_3 \sin t$. Invoking the initial conditions, we obtain the system of equations

$$c_1 + c_2 = 2$$

$$c_1 + c_3 = -1$$

$$c_1 - c_2 = -2$$

with solution $c_1 = 0, c_2 = 2, c_3 = -1$. Therefore the solution of the initial value problem is $y(t) = 2 \cos t - \sin t$.

33. The characteristic equation is $2r^4 - r^3 - 9r^2 + 4r + 4 = 0$, with roots $r = -1/2, 1, \pm 2$. Hence the general solution is $y(t) = c_1 e^{-t/2} + c_2 e^t + c_3 e^{-2t} + c_4 e^{2t}$. Applying the initial conditions, we obtain the system of equations

$$c_1 + c_2 + c_3 + c_4 = -2$$

$$-\frac{1}{2}c_1 + c_2 - 2c_3 + 2c_4 = 0$$

$$\frac{1}{4}c_1 + c_2 + 4c_3 + 4c_4 = -2$$

$$-\frac{1}{8}c_1 + c_2 - 8c_3 + 8c_4 = 0$$

with solution $c_1 = -16/15$, $c_2 = -2/3$, $c_3 = -1/6$, $c_4 = -1/10$. Therefore the solution of the initial value problem is $y(t) = -\frac{16}{15}e^{-t/2} - \frac{2}{3}e^t - \frac{1}{6}e^{-2t} - \frac{1}{10}e^{2t}$.

The solution decreases without bound.

34. $y(t) = \frac{2}{13}e^{-t} + e^{t/2} \left[\frac{24}{13} \cos t + \frac{3}{13} \sin t \right]$.

The solution is an oscillation with increasing amplitude.

35. The characteristic equation is $6r^3 + 5r^2 + r = 0$, with roots $r = 0, -1/3, -1/2$. The general solution is $y(t) = c_1 + c_2e^{-t/3} + c_3e^{-t/2}$. Invoking the initial conditions, we require that

$$\begin{aligned} c_1 + c_2 + c_3 &= -2 \\ -\frac{1}{3}c_2 - \frac{1}{2}c_3 &= 2 \\ \frac{1}{9}c_2 + \frac{1}{4}c_3 &= 0. \end{aligned}$$

The solution is $c_1 = 8$, $c_2 = -18$, $c_3 = 8$. Therefore the solution of the initial value problem is $y(t) = 8 - 18e^{-t/3} + 8e^{-t/2}$.

36. The general solution is derived in Problem 28 as

$$y(t) = e^{-t} [c_1 \cos t + c_2 \sin t] + e^{-2t} [c_3 \cos \sqrt{3}t + c_4 \sin \sqrt{3}t].$$

Invoking the initial conditions, we obtain the system of equations

$$\begin{aligned} c_1 + c_3 &= 1 \\ -c_1 + c_2 - 2c_3 + \sqrt{3}c_4 &= -2 \\ -2c_2 + c_3 - 4\sqrt{3}c_4 &= 0 \\ 2c_1 + 2c_2 + 10c_3 + 9\sqrt{3}c_4 &= 3 \end{aligned}$$

with solution $c_1 = 21/13$, $c_2 = -38/13$, $c_3 = -8/13$, $c_4 = 17\sqrt{3}/39$.

The solution is a rapidly-decaying oscillation.

38. (b) $W(e^t, e^{-t}, \cos t, \sin t) = -8$.

(c) $W(\cosh t, \sinh t, \cos t, \sin t) = 4$.

40. Suppose that $c_1 e^{r_1 t} + c_2 e^{r_2 t} + \dots + c_n e^{r_n t} = 0$, and each of the r_k are real and different. Multiplying this equation by $e^{-r_1 t}$, $c_1 + c_2 e^{(r_2-r_1)t} + \dots + c_n e^{(r_n-r_1)t} = 0$. Differentiation results in

$$c_2(r_2 - r_1)e^{(r_2-r_1)t} + \dots + c_n(r_n - r_1)e^{(r_n-r_1)t} = 0.$$

Now multiplying the latter equation by $e^{-(r_2-r_1)t}$, and differentiating, we obtain

$$c_3(r_3 - r_2)(r_3 - r_1)e^{(r_3-r_2)t} + \dots + c_n(r_n - r_2)(r_n - r_1)e^{(r_n-r_2)t} = 0.$$

Following the above steps in a similar manner, it follows that

$$c_n(r_n - r_{n-1}) \dots (r_n - r_1)e^{(r_n-r_{n-1})t} = 0.$$

Since these equations hold for all t , and all the r_k are different, we have $c_n = 0$. Hence

$$c_1e^{r_1t} + c_2e^{r_2t} + \dots + c_{n-1}e^{r_{n-1}t} = 0, \quad -\infty < t < \infty.$$

The same procedure can now be repeated, successively, to show that

$$c_1 = c_2 = \dots = c_n = 0.$$

41.(a) Recall the derivative formula

$$\frac{d^n}{dx^n}(uv) = \binom{n}{0}v \frac{d^n u}{dx^n} + \binom{n}{1}\frac{dv}{dx} \frac{d^{n-1}u}{dx^{n-1}} + \dots + \binom{n}{n}\frac{d^n v}{dx^n}u.$$

Let $u = (r - r_1)^s$ and $v = q(r)$. Note that

$$\frac{d^n}{dr^n}[(r - r_1)^s] = s \cdot (s - 1) \dots (s - n + 1)(r - r_1)^{s-n}$$

and

$$\frac{d^s}{dr^s}[(r - r_1)^s] = s!.$$

Therefore

$$\frac{d^n}{dr^n}[(r - r_1)^s q(r)] \Big|_{r=r_1} = 0$$

only if $n < s$, since it is assumed that $q(r_1) \neq 0$.

(b) Differential operators commute, so that

$$\frac{\partial}{\partial r} \left(\frac{d^k}{dt^k} e^{rt} \right) = \frac{d^k}{dt^k} \left(\frac{\partial}{\partial r} e^{rt} \right) = \frac{d^k}{dt^k} (t e^{rt}).$$

Likewise,

$$\frac{\partial^j}{\partial r^j} \left(\frac{d^k}{dt^k} e^{rt} \right) = \frac{d^k}{dt^k} \left(\frac{\partial^j}{\partial r^j} e^{rt} \right) = \frac{d^k}{dt^k} (t^j e^{rt}).$$

It follows that

$$\frac{\partial^j}{\partial r^j} L[e^{rt}] = L[t^j e^{rt}].$$

From Eq. (i), we have

$$\frac{\partial^j}{\partial r^j} [e^{rt} Z(r)] = L[t^j e^{rt}].$$

Based on the product formula in Part (a),

$$\frac{\partial^j}{\partial r^j} [e^{rt} Z(r)] \Big|_{r=r_1} = 0$$

if $j < s$. Therefore $L[t^j e^{rt}] = 0$ if $j < s$.

4.3

2. The general solution of the homogeneous equation is

$$y_c = c_1 e^t + c_2 e^{-t} + c_3 \cos t + c_4 \sin t.$$

Let $g_1(t) = 3t$ and $g_2(t) = \cos t$. By inspection, we find that $Y_1(t) = -3t$. Since $g_2(t)$ is a solution of the homogeneous equation, set $Y_2(t) = t(A \cos t + B \sin t)$. Substitution into the given ODE and comparing the coefficients of similar term results in $A = 0$ and $B = -1/4$. Hence the general solution of the nonhomogeneous problem is

$$y(t) = y_c(t) - 3t - \frac{t}{4} \sin t.$$

3. The characteristic equation corresponding to the homogeneous problem can be written as $(r+1)(r^2+1) = 0$. The solution of the homogeneous equation is $y_c = c_1 e^{-t} + c_2 \cos t + c_3 \sin t$. Let $g_1(t) = e^{-t}$ and $g_2(t) = 4t$. Since $g_1(t)$ is a solution of the homogeneous equation, set $Y_1(t) = Ate^{-t}$. Substitution into the ODE results in $A = 1/2$. Now let $Y_2(t) = Bt + C$. We find that $B = -C = 4$. Hence the general solution of the nonhomogeneous problem is $y(t) = y_c(t) + te^{-t}/2 + 4(t-1)$.

4. The characteristic equation corresponding to the homogeneous problem can be written as $r(r+1)(r-1) = 0$. The solution of the homogeneous equation is $y_c = c_1 + c_2 e^t + c_3 e^{-t}$. Since $g(t) = 2 \sin t$ is not a solution of the homogeneous problem, we can set $Y(t) = A \cos t + B \sin t$. Substitution into the ODE results in $A = 1$ and $B = 0$. Thus the general solution is $y(t) = c_1 + c_2 e^t + c_3 e^{-t} + \cos t$.

6. The characteristic equation corresponding to the homogeneous problem can be written as $(r^2+1)^2 = 0$. It follows that

$$y_c = c_1 \cos t + c_2 \sin t + t(c_3 \cos t + c_4 \sin t).$$

Since $g(t)$ is not a solution of the homogeneous problem, set $Y(t) = A + B \cos 2t + C \sin 2t$. Substitution into the ODE results in $A = 3$, $B = 1/9$, $C = 0$. Thus the general solution is $y(t) = y_c(t) + 3 + \frac{1}{9} \cos 2t$.

7. The characteristic equation corresponding to the homogeneous problem can be written as $r^3(r^3+1) = 0$. Thus the homogeneous solution is

$$y_c = c_1 + c_2 t + c_3 t^2 + c_4 e^{-t} + e^{t/2} \left[c_5 \cos(\sqrt{3} t/2) + c_6 \sin(\sqrt{3} t/2) \right].$$

Note the $g(t) = t$ is a solution of the homogenous problem. Consider a particular solution of the form $Y(t) = t^3(At + B)$. Substitution into the ODE gives us that $A = 1/24$ and $B = 0$. Thus the general solution is $y(t) = y_c(t) + t^4/24$.

8. The characteristic equation corresponding to the homogeneous problem can be written as $r^3(r+1) = 0$. Hence the homogeneous solution is

$$y_c = c_1 + c_2 t + c_3 t^2 + c_4 e^{-t}.$$

Since $g(t)$ is not a solution of the homogeneous problem, set $Y(t) = A \cos 2t + B \sin 2t$. Substitution into the ODE results in $A = 1/40$ and $B = 1/20$. Thus the general solution is $y(t) = y_c(t) + (\cos 2t + 2 \sin 2t)/40$.

10. From Problem 22 in Section 4.2, the homogeneous solution is

$$y_c = c_1 \cos t + c_2 \sin t + t[c_3 \cos t + c_4 \sin t].$$

Since $g(t)$ is not a solution of the homogeneous problem, substitute $Y(t) = At + B$ into the ODE to obtain $A = 3$ and $B = 4$. Thus the general solution is $y(t) = y_c(t) + 3t + 4$. Invoking the initial conditions, we find that $c_1 = -4$, $c_2 = -4$, $c_3 = 1$, $c_4 = -3/2$. Therefore the solution of the initial value problem is

$$y(t) = (t - 4) \cos t - (3t/2 + 4) \sin t + 3t + 4.$$

11. The characteristic equation can be written as $r(r^2 - 3r + 2) = 0$. Hence the homogeneous solution is $y_c = c_1 + c_2 e^t + c_3 e^{2t}$. Let $g_1(t) = e^t$ and $g_2(t) = t$. Note that g_1 is a solution of the homogeneous problem. Set $Y_1(t) = Ate^t$. Substitution into the ODE results in $A = -1$. Now let $Y_2(t) = Bt^2 + Ct$. Substitution into the ODE results in $B = 1/4$ and $C = 3/4$. Therefore the general solution is

$$y(t) = c_1 + c_2 e^t + c_3 e^{2t} - te^t + (t^2 + 3t)/4.$$

Invoking the initial conditions, we find that $c_1 = 1$, $c_2 = c_3 = 0$. The solution of the initial value problem is $y(t) = 1 - te^t + (t^2 + 3t)/4$.

12. The characteristic equation can be written as $(r - 1)(r + 3)(r^2 + 4) = 0$. Hence the homogeneous solution is $y_c = c_1 e^t + c_2 e^{-3t} + c_3 \cos 2t + c_4 \sin 2t$. None of the terms in $g(t)$ is a solution of the homogeneous problem. Therefore we can assume a form $Y(t) = Ae^{-t} + B \cos t + C \sin t$. Substitution into the ODE results in the values $A = 1/20$, $B = -2/5$, $C = -4/5$. Hence the general solution is

$$y(t) = c_1 e^t + c_2 e^{-3t} + c_3 \cos 2t + c_4 \sin 2t + e^{-t}/20 - (2 \cos t + 4 \sin t)/5.$$

Invoking the initial conditions, we find that $c_1 = 81/40$, $c_2 = 73/520$, $c_3 = 77/65$, $c_4 = -49/130$.

14. From Problem 4, the homogeneous solution is $y_c = c_1 + c_2 e^t + c_3 e^{-t}$. Consider the terms $g_1(t) = te^{-t}$ and $g_2(t) = 2 \cos t$. Note that since $r = -1$ is a simple root of the characteristic equation, we set $Y_1(t) = t(At + B)e^{-t}$. The function $2 \cos t$ is not a solution of the homogeneous equation. We set $Y_2(t) = C \cos t + D \sin t$. Hence the particular solution has the form

$$Y(t) = t(At + B)e^{-t} + C \cos t + D \sin t.$$

15. The characteristic equation can be written as $(r^2 - 1)^2 = 0$. The roots are given as $r = \pm 1$, each with multiplicity two. Hence the solution of the homogeneous problem is $y_c = c_1 e^t + c_2 t e^t + c_3 e^{-t} + c_4 t e^{-t}$. Let $g_1(t) = e^t$ and $g_2(t) = \sin t$. The function e^t is a solution of the homogeneous problem. Since $r = 1$ has multiplicity two, we set $Y_1(t) = At^2 e^t$. The function $\sin t$ is not a solution of the homogeneous equation. We can set $Y_2(t) = B \cos t + C \sin t$. Hence the particular solution has the form

$$Y(t) = At^2 e^t + B \cos t + C \sin t.$$

16. The characteristic equation can be written as $r^2(r^2 + 4) = 0$, and the roots are $r = 0, \pm 2i$. The root $r = 0$ has multiplicity two, hence the homogeneous solution is $y_c = c_1 + c_2 t + c_3 \cos 2t + c_4 \sin 2t$. The functions $g_1(t) = \sin 2t$ and $g_2(t) = 4$ are solutions of the homogeneous equation. The complex roots have multiplicity one, therefore we need to set $Y_1(t) = At \cos 2t + Bt \sin 2t$. Now $g_2(t) = 4$ is associated with the double root $r = 0$, so we set $Y_2(t) = Ct^2$. Finally, $g_3(t) = te^t$

(and its derivatives) is independent of the homogeneous solution. Therefore set $Y_3(t) = (Dt + E)e^t$. Conclude that the particular solution has the form

$$Y(t) = At \cos 2t + Bt \sin 2t + Ct^2 + (Dt + E)e^t.$$

18. The characteristic equation can be written as $r^2(r^2 + 2r + 2) = 0$, with roots $r = 0$, with multiplicity two, and $r = -1 \pm i$. This means that the homogeneous solution is $y_c = c_1 + c_2t + c_3e^{-t} \cos t + c_4e^{-t} \sin t$. The function $g_1(t) = 3e^t + 2te^{-t}$, and all of its derivatives, is independent of the homogeneous solution. Therefore set $Y_1(t) = Ae^t + (Bt + C)e^{-t}$. Now $g_2(t) = e^{-t} \sin t$ is a solution of the homogeneous equation, associated with the complex roots. We need to set $Y_2(t) = t(De^{-t} \cos t + Ee^{-t} \sin t)$. It follows that the particular solution has the form

$$Y(t) = Ae^t + (Bt + C)e^{-t} + t(De^{-t} \cos t + Ee^{-t} \sin t).$$

19. Differentiating $y = u(t)v(t)$, successively, we have

$$\begin{aligned} y' &= u'v + uv' \\ y'' &= u''v + 2u'v' + uv'' \\ &\vdots \\ y^{(n)} &= \sum_{j=0}^n \binom{n}{j} u^{(n-j)} v^{(j)} \end{aligned}$$

Setting $v(t) = e^{\alpha t}$, $v^{(j)} = \alpha^j e^{\alpha t}$. So for any $p = 1, 2, \dots, n$,

$$y^{(p)} = e^{\alpha t} \sum_{j=0}^p \binom{p}{j} \alpha^j u^{(p-j)}.$$

It follows that

$$L[e^{\alpha t} u] = e^{\alpha t} \sum_{p=0}^n \left[a_{n-p} \sum_{j=0}^p \binom{p}{j} \alpha^j u^{(p-j)} \right] \quad (*).$$

It is evident that the right hand side of Eq. (*) is of the form

$$e^{\alpha t} \left[k_0 u^{(n)} + k_1 u^{(n-1)} + \dots + k_{n-1} u' + k_n u \right].$$

Hence the operator equation $L[e^{\alpha t} u] = e^{\alpha t} (b_0 t^m + b_1 t^{m-1} + \dots + b_{m-1} t + b_m)$ can be written as

$$\begin{aligned} k_0 u^{(n)} + k_1 u^{(n-1)} + \dots + k_{n-1} u' + k_n u &= \\ &= b_0 t^m + b_1 t^{m-1} + \dots + b_{m-1} t + b_m. \end{aligned}$$

The coefficients k_i , $i = 0, 1, \dots, n$ can be determined by collecting the like terms in the double summation in Eq. (*). For example, k_0 is the coefficient of $u^{(n)}$. The only term that contains $u^{(n)}$ is when $p = n$ and $j = 0$. Hence $k_0 = a_0$. On

the other hand, k_n is the coefficient of $u(t)$. The inner summation in $(*)$ contains terms with u , given by $\alpha^p u$ (when $j = p$), for each $p = 0, 1, \dots, n$. Hence

$$k_n = \sum_{p=0}^n a_{n-p} \alpha^p.$$

21.(a) Clearly, e^{2t} is a solution of $y' - 2y = 0$, and te^{-t} is a solution of the differential equation $y'' + 2y' + y = 0$. The latter ODE has characteristic equation $(r+1)^2 = 0$. Hence

$$(D-2)[3e^{2t}] = 3(D-2)[e^{2t}] = 0$$

and

$$(D+1)^2[te^{-t}] = 0.$$

Furthermore, we have

$$(D-2)(D+1)^2[te^{-t}] = (D-2)[0] = 0,$$

and

$$(D-2)(D+1)^2[3e^{2t}] = (D+1)^2(D-2)[3e^{2t}] = (D+1)^2[0] = 0.$$

(b) Based on part (a),

$$(D-2)(D+1)^2[(D-2)^3(D+1)Y] = (D-2)(D+1)^2[3e^{2t} - te^{-t}] = 0,$$

since the operators are linear. The implied operations are associative and commutative. Hence

$$(D-2)^4(D+1)^3Y = 0.$$

The operator equation corresponds to the solution of a linear homogeneous ODE with characteristic equation $(r-2)^4(r+1)^3 = 0$. The roots are $r = 2$, with multiplicity 4 and $r = -1$, with multiplicity 3. It follows that the given homogeneous solution is

$$Y(t) = c_1 e^{2t} + c_2 t e^{2t} + c_3 t^2 e^{2t} + c_4 t^3 e^{2t} + c_5 e^{-t} + c_6 t e^{-t} + c_7 t^2 e^{-t},$$

which is a linear combination of seven independent solutions.

22. (15) Observe that $(D-1)[e^t] = 0$ and $(D^2+1)[\sin t] = 0$. Hence the operator $H(D) = (D-1)(D^2+1)$ is an annihilator of $e^t + \sin t$. The operator corresponding to the left hand side of the given ODE is $(D^2-1)^2$. It follows that

$$(D+1)^2(D-1)^3(D^2+1)Y = 0.$$

The resulting ODE is homogeneous, with solution

$$Y(t) = c_1 e^{-t} + c_2 t e^{-t} + c_3 e^t + c_4 t e^t + c_5 t^2 e^t + c_6 \cos t + c_7 \sin t.$$

After examining the homogeneous solution of Problem 15, and eliminating duplicate terms, we have

$$Y(t) = c_5 t^2 e^t + c_6 \cos t + c_7 \sin t.$$

22. (16) We find that $D[4] = 0$, $(D-1)^2[te^t] = 0$, and $(D^2+4)[\sin 2t] = 0$. The operator $H(D) = D(D-1)^2(D^2+4)$ is an annihilator of $t^2 + te^t + \sin 2t$. The operator corresponding to the left hand side of the ODE is $D^2(D^2+4)$. It follows that

$$D^3(D-1)^2(D^2+4)^2Y = 0.$$

The resulting ODE is homogeneous, with solution

$$Y(t) = c_1 + c_2t + c_3t^2 + c_4e^t + c_5te^t + c_6\cos 2t + c_7\sin 2t + c_8t\cos 2t + c_9t\sin 2t.$$

After examining the homogeneous solution of Problem 16, and eliminating duplicate terms, we have

$$Y(t) = c_3t^2 + c_4e^t + c_5te^t + c_8t\cos 2t + c_9t\sin 2t.$$

22. (18) Observe that $(D-1)[e^t] = 0$, $(D+1)^2[te^{-t}] = 0$. The function $e^{-t}\sin t$ is a solution of a second order ODE with characteristic roots $r = -1 \pm i$. It follows that $(D^2+2D+2)[e^{-t}\sin t] = 0$. Therefore the operator

$$H(D) = (D-1)(D+1)^2(D^2+2D+2)$$

is an annihilator of $3e^t + 2te^{-t} + e^{-t}\sin t$. The operator corresponding to the left hand side of the given ODE is $D^2(D^2+2D+2)$. It follows that

$$D^2(D-1)(D+1)^2(D^2+2D+2)^2Y = 0.$$

The resulting ODE is homogeneous, with solution

$$Y(t) = c_1 + c_2t + c_3e^t + c_4e^{-t} + c_5te^{-t} + e^{-t}(c_6\cos t + c_7\sin t) + te^{-t}(c_8\cos t + c_9\sin t).$$

After examining the homogeneous solution of Problem 18, and eliminating duplicate terms, we have

$$Y(t) = c_3e^t + c_4e^{-t} + c_5te^{-t} + te^{-t}(c_8\cos t + c_9\sin t).$$

4.4

2. The characteristic equation is $r(r^2-1) = 0$. Hence the homogeneous solution is $y_c(t) = c_1 + c_2e^t + c_3e^{-t}$. The Wronskian is evaluated as $W(1, e^t, e^{-t}) = 2$. Now compute the three determinants

$$W_1(t) = \begin{vmatrix} 0 & e^t & e^{-t} \\ 0 & e^t & -e^{-t} \\ 1 & e^t & e^{-t} \end{vmatrix} = -2,$$

$$W_2(t) = \begin{vmatrix} 1 & 0 & e^{-t} \\ 0 & 0 & -e^{-t} \\ 0 & 1 & e^{-t} \end{vmatrix} = e^{-t},$$

$$W_3(t) = \begin{vmatrix} 1 & e^t & 0 \\ 0 & e^t & 0 \\ 0 & e^t & 1 \end{vmatrix} = e^t.$$

The solution of the system of equations (10) is

$$u_1'(t) = \frac{t W_1(t)}{W(t)} = -t,$$

$$u_2'(t) = \frac{t W_2(t)}{W(t)} = te^{-t}/2,$$

$$u_3'(t) = \frac{t W_3(t)}{W(t)} = te^t/2.$$

Hence $u_1(t) = -t^2/2$, $u_2(t) = -e^{-t}(t+1)/2$, $u_3(t) = e^t(t-1)/2$. The particular solution becomes $Y(t) = -t^2/2 - (t+1)/2 + (t-1)/2 = -t^2/2 - 1$. The constant is a solution of the homogeneous equation, therefore the general solution is

$$y(t) = c_1 + c_2 e^t + c_3 e^{-t} - t^2/2.$$

3. From Problem 13 in Section 4.2, $y_c(t) = c_1 e^{-t} + c_2 e^t + c_3 e^{2t}$. The Wronskian is evaluated as $W(e^{-t}, e^t, e^{2t}) = 6e^{2t}$. Now compute the three determinants

$$W_1(t) = \begin{vmatrix} 0 & e^t & e^{2t} \\ 0 & e^t & 2e^{2t} \\ 1 & e^t & 4e^{2t} \end{vmatrix} = e^{3t},$$

$$W_2(t) = \begin{vmatrix} e^{-t} & 0 & e^{2t} \\ -e^{-t} & 0 & 2e^{2t} \\ e^{-t} & 1 & 4e^{2t} \end{vmatrix} = -3e^t,$$

$$W_3(t) = \begin{vmatrix} e^{-t} & e^t & 0 \\ -e^{-t} & e^t & 0 \\ e^{-t} & e^t & 1 \end{vmatrix} = 2.$$

Hence $u_1'(t) = e^{5t}/6$, $u_2'(t) = -e^{3t}/2$, $u_3'(t) = e^{2t}/3$. Therefore the particular solution can be expressed as

$$Y(t) = e^{-t} [e^{5t}/30] - e^t [e^{3t}/6] + e^{2t} [e^{2t}/6] = e^{4t}/30.$$

6. From Problem 22 in Section 4.2,

$$y_c(t) = c_1 \cos t + c_2 \sin t + t [c_3 \cos t + c_4 \sin t].$$

The Wronskian is evaluated as $W(\cos t, \sin t, t \cos t, t \sin t) = 4$. Now compute the four auxiliary determinants

$$\begin{aligned} W_1(t) &= \begin{vmatrix} 0 & \sin t & t \cos t & t \sin t \\ 0 & \cos t & \cos t - t \sin t & \sin t + t \cos t \\ 0 & -\sin t & -2 \sin t - t \cos t & 2 \cos t - t \sin t \\ 1 & -\cos t & -3 \cos t + t \sin t & -3 \sin t - t \cos t \end{vmatrix} = \\ &= -2 \sin t + 2t \cos t, \end{aligned}$$

$$\begin{aligned}
W_2(t) &= \begin{vmatrix} \cos t & 0 & t \cos t & t \sin t \\ -\sin t & 0 & \cos t - t \sin t & \sin t + t \cos t \\ -\cos t & 0 & -2 \sin t - t \cos t & 2 \cos t - t \sin t \\ \sin t & 1 & -3 \cos t + t \sin t & -3 \sin t - t \cos t \end{vmatrix} = \\
&= 2t \sin t + 2 \cos t, \\
W_3(t) &= \begin{vmatrix} \cos t & \sin t & 0 & t \sin t \\ -\sin t & \cos t & 0 & \sin t + t \cos t \\ -\cos t & -\sin t & 0 & 2 \cos t - t \sin t \\ \sin t & -\cos t & 1 & -3 \sin t - t \cos t \end{vmatrix} = -2 \cos t, \\
W_4(t) &= \begin{vmatrix} \cos t & \sin t & t \cos t & 0 \\ -\sin t & \cos t & \cos t - t \sin t & 0 \\ -\cos t & -\sin t & -2 \sin t - t \cos t & 0 \\ \sin t & -\cos t & -3 \cos t + t \sin t & 1 \end{vmatrix} = -2 \sin t.
\end{aligned}$$

It follows that

$$\begin{aligned}
u_1'(t) &= [-\sin^2 t + t \sin t \cos t] / 2, \\
u_2'(t) &= [t \sin^2 t + \sin t \cos t] / 2, \\
u_3'(t) &= -\sin t \cos t / 2, \\
u_4'(t) &= -\sin^2 t / 2.
\end{aligned}$$

Hence

$$\begin{aligned}
u_1(t) &= [3 \sin t \cos t - 2t \cos^2 t - t] / 8, \\
u_2(t) &= [\sin^2 t - 2 \cos^2 t - 2t \sin t \cos t + t^2] / 8, \\
u_3(t) &= -\sin^2 t / 4, \\
u_4(t) &= [\cos t \sin t - t] / 4.
\end{aligned}$$

Therefore the particular solution can be expressed as

$$\begin{aligned}
Y(t) &= \cos t [u_1(t)] + \sin t [u_2(t)] + t \cos t [u_3(t)] + t \sin t [u_4(t)] \\
&= [\sin t - 3t \cos t - t^2 \sin t] / 8.
\end{aligned}$$

Note that only the last term is not a solution of the homogeneous equation. Hence the general solution is

$$y(t) = c_1 \cos t + c_2 \sin t + t [c_3 \cos t + c_4 \sin t] - t^2 \sin t / 8.$$

8. Based on the results in Problem 2, $y_c(t) = c_1 + c_2 e^t + c_3 e^{-t}$. It was also shown that $W(1, e^t, e^{-t}) = 2$, with $W_1(t) = -2$, $W_2(t) = e^{-t}$, $W_3(t) = e^t$. Therefore we have $u_1'(t) = -\csc t$, $u_2'(t) = e^{-t} \csc t / 2$, $u_3'(t) = e^t \csc t / 2$. The particular solution can be expressed as $Y(t) = [u_1(t)] + e^{-t} [u_2(t)] + e^t [u_3(t)]$. More specifically,

$$\begin{aligned}
Y(t) &= \ln |\csc(t) + \cot(t)| + \frac{e^t}{2} \int_{t_0}^t e^{-s} \csc(s) ds + \frac{e^{-t}}{2} \int_{t_0}^t e^s \csc(s) ds \\
&= \ln |\csc(t) + \cot(t)| + \int_{t_0}^t \cosh(t-s) \csc(s) ds.
\end{aligned}$$

9. Based on Problem 4, $u_1'(t) = \sec t$, $u_2'(t) = -1$, $u_3'(t) = -\tan t$. The particular solution can be expressed as $Y(t) = [u_1(t)] + \cos t [u_2(t)] + \sin t [u_3(t)]$. That is,

$$Y(t) = \ln |\sec(t) + \tan(t)| - t \cos t + \sin t \ln |\cos(t)|.$$

Hence the general solution of the initial value problem is

$$y(t) = c_1 + c_2 \cos t + c_3 \sin t + \ln |\sec(t) + \tan(t)| - t \cos t + \sin t \ln |\cos(t)|.$$

Invoking the initial conditions, we require that $c_1 + c_2 = 2$, $c_3 = 1$, $-c_2 = -2$. Therefore

$$y(t) = 2 \cos t + \sin t + \ln |\sec(t) + \tan(t)| - t \cos t + \sin t \ln |\cos(t)|$$

10. From Problem 6, $y(t) = c_1 \cos t + c_2 \sin t + c_3 t \cos t + c_4 t \sin t - t^2 \sin t / 8$. In order to satisfy the initial conditions, we require that $c_1 = 2$, $c_2 + c_3 = 0$, $-c_1 + 2c_4 = -1$, $-3/4 - c_2 - 3c_3 = 1$. Therefore

$$y(t) = 2 \cos t + [7 \sin t - 7t \cos t + 4t \sin t - t^2 \sin t] / 8.$$

12. From Problem 8, the general solution of the initial value problem is

$$y(t) = c_1 + c_2 e^t + c_3 e^{-t} + \ln |\csc(t) + \cot(t)| + \\ + \frac{e^t}{2} \int_{t_0}^t e^{-s} \csc(s) ds + \frac{e^{-t}}{2} \int_{t_0}^t e^s \csc(s) ds.$$

In this case, $t_0 = \pi/2$. Observe that $y(\pi/2) = y_c(\pi/2)$, $y'(\pi/2) = y'_c(\pi/2)$, and $y''(\pi/2) = y''_c(\pi/2)$. Therefore we obtain the system of equations

$$\begin{aligned}c_1 + c_2 e^{\pi/2} + c_3 e^{-\pi/2} &= 2 \\c_2 e^{\pi/2} - c_3 e^{-\pi/2} &= 1 \\c_2 e^{\pi/2} + c_3 e^{-\pi/2} &= -1\end{aligned}$$

Hence the solution of the initial value problem is

$$y(t) = 3 - e^{-t+\pi/2} + \ln |\csc(t) + \cot(t)| + \int_{t_0}^t \cosh(t-s) \csc(s) ds.$$

13. First write the equation as $y''' + x^{-1}y'' - 2x^{-2}y' + 2x^{-3}y = 2x$. The Wronskian is evaluated as $W(x, x^2, 1/x) = 6/x$. Now compute the three determinants

$$W_1(x) = \begin{vmatrix} 0 & x^2 & 1/x \\ 0 & 2x & -1/x^2 \\ 1 & 2 & 2/x^3 \end{vmatrix} = -3,$$

$$W_2(x) = \begin{vmatrix} x & 0 & 1/x \\ 1 & 0 & -1/x^2 \\ 0 & 1 & 2/x^3 \end{vmatrix} = 2/x,$$

$$W_3(x) = \begin{vmatrix} x & x^2 & 0 \\ 1 & 2x & 0 \\ 0 & 2 & 1 \end{vmatrix} = x^2.$$

Hence $u_1'(x) = -x^2$, $u_2'(x) = 2x/3$, $u_3'(x) = x^4/3$. Therefore the particular solution can be expressed as

$$Y(x) = x[-x^3/3] + x^2[x^2/3] + \frac{1}{x}[x^5/15] = x^4/15.$$

15. The homogeneous solution is $y_c(t) = c_1 \cos t + c_2 \sin t + c_3 \cosh t + c_4 \sinh t$. The Wronskian is evaluated as $W(\cos t, \sin t, \cosh t, \sinh t) = 4$. Now the four additional determinants are given by $W_1(t) = 2 \sin t$, $W_2(t) = -2 \cos t$, $W_3(t) = -2 \sinh t$, $W_4(t) = 2 \cosh t$. It follows that

$$u_1'(t) = g(t) \sin(t)/2, \quad u_2'(t) = -g(t) \cos(t)/2,$$

$$u_3'(t) = -g(t) \sinh(t)/2, \quad u_4'(t) = g(t) \cosh(t)/2.$$

Therefore the particular solution can be expressed as

$$\begin{aligned} Y(t) = & \frac{\cos(t)}{2} \int_{t_0}^t g(s) \sin(s) ds - \frac{\sin(t)}{2} \int_{t_0}^t g(s) \cos(s) ds - \\ & - \frac{\cosh(t)}{2} \int_{t_0}^t g(s) \sinh(s) ds + \frac{\sinh(t)}{2} \int_{t_0}^t g(s) \cosh(s) ds. \end{aligned}$$

Using the appropriate identities, the integrals can be combined to obtain

$$Y(t) = \frac{1}{2} \int_{t_0}^t g(s) \sinh(t-s) ds - \frac{1}{2} \int_{t_0}^t g(s) \sin(t-s) ds.$$

17. First write the equation as $y''' - 3x^{-1}y'' + 6x^{-2}y' - 6x^{-3}y = g(x)/x^3$. It can be shown that $y_c(x) = c_1x + c_2x^2 + c_3x^3$ is a solution of the homogeneous equation. The Wronskian of this fundamental set of solutions is $W(x, x^2, x^3) = 2x^3$. The three additional determinants are given by $W_1(x) = x^4$, $W_2(x) = -2x^3$, $W_3(x) = x^2$. Hence $u_1'(x) = g(x)/2x^2$, $u_2'(x) = -g(x)/x^3$, $u_3'(x) = g(x)/2x^4$. Now the particular solution can be expressed as

$$\begin{aligned} Y(x) = & x \int_{x_0}^x \frac{g(t)}{2t^2} dt - x^2 \int_{x_0}^x \frac{g(t)}{t^3} dt + x^3 \int_{x_0}^x \frac{g(t)}{2t^4} dt \\ = & \frac{1}{2} \int_{x_0}^x \left[\frac{x}{t^2} - \frac{2x^2}{t^3} + \frac{x^3}{t^4} \right] g(t) dt. \end{aligned}$$
